

Telecontrol of Installations

AGE 44

Description

The AE/SA-TC system allows remote control and management of fire detection facilities. It provides substantial major advantages in new facilities, as well as in maintaining those presently in service.

This system allows remote control of any installation based on the AE/SA-Cx algorithmic panels. It includes a control software package (AGE44) that allows the fire control panel connected to it to be displayed on the monitor of the computer, and any action to be taken on the same just as if we were standing in front of the actual fire panel.

It is specially suitable in those facilities where remote control is required ascertain hours of the day from a location other than where the panel is situated, like night-watchman positions for example.

The system accepts extensive possibilities for network connections:

- Serial ports, RS-232 and RS-485,
- AE2NET network
- INTERNET, by means of protocol TCP/IP
