

Seismic Test

The VT610P is a small, convenient, hand-held test unit, which is used to verify the operation of the seismic detectors when installed on a safe or another metal surface. You can determine the detection range by pressing the tester against the protected surface, a noise will be heard that simulates an attack with a thermal lance. This tool will help you to plan your installation and verify how many seismic detectors you need to install on the object.

Standard Features

- Hand held test unit for seismic detectors
- Range tester
- 9V battery
